## Reference Point

## Executive Summary

After seeing significant gains in participant deferrals and participation rates in 2016, plan and participant outcomes improved again in 2017. Plan design continued to be one of the strongest drivers of outcomes, led by features such as auto-enrollment and auto-increases with opt-out as well as adoption of higher default deferral rates, Roth contributions, and target date products.

## 67\%

of plans offer Roth contributions

## Auto-Solutions

Plan design continues to drive positive outcomes for plans and participants.

- The 6\% default deferral rate for auto-enrollment plans surpassed the 3\% industry standard for the first time by a small amount: $32.4 \%$ of plans had a $6 \%$ default deferral compared with $31.9 \%$ with a $3 \%$ default.
- Participation in auto-enrollment plans is 42 percentage points higher than in non-auto-enrollment plans ( $87 \%$ compared with $45 \%$ ).
■ Adoption of auto-increases is over five times higher in plans with opt-out versus opt-in ( $66 \%$ compared with 13\%).

## Nearly two-thirds of plans have set or increased the default rate to an amount greater than $3 \%$.

## Contributions

The average employee pretax deferral rate reaches 8.3\%-the highest in 10 years.

■ Over 67\% of plans now offer Roth contributions, up from 60.3\% in 2016.
■ Younger participants (age 20-40) use Roth contributions more often than their older peers.

- Nearly half of all plans with a match set the match ceiling at 6\%.

■ The most popular match formula-50\% up to $6 \%-$ is used by $31.8 \%$ of plans with a match.

O Adoption of Roth increased in 2017-by plans and by participantswhich could demonstrate increased understanding of the feature.

## 94\% <br> of plans

 offer target date products
## 16\% <br> of participants

had multiple loans, down four percentage points from 2013

## Investments

The average number of investments offered by plans continues to increase, despite growing popularity of target date products.

- For the first time, target date products now account for the largest percentage of plan assets under management, surpassing all other investment types in nearly every category.
- Investment in target date products is highest among participants age 20-40, who are more likely to have been auto-enrolled than their older peers.

Plans with a high number of participants who appear to be non-diversified might consider a "QDIA reset," which moves participants' existing balances and future contributions into a qualified default investment alternative ("QDIA"), with an appropriately communicated opt-out option. This should be considered in light of other alternatives, such as investment education regarding the importance of diversification.

## Loan And Disbursement Behavior

Loan usage decreased to 23.4\%, but a greater number of participants age 50+ have outstanding loans.

- The percentage of participants with multiple loans decreased to 15.6\% in 2017, a drop of four percentage points since 2013.
- There was no change in direct rollovers, cash-outs, or hardship withdrawal usage overall, although cash-outs increased among younger participants.

Education and plan design can help participants avoid tapping into their retirement savings.

# Reference Point 

## Auto-Solutions

## Plan Design Drives Outcomes

Ever since the Pension Protection Act gave employers a certain degree of legal certainty in 2006, adoption of autosolutions has steadily grown. The proven successes of auto-enrollment and auto-increase features have further strengthened their popularity among plans at T. Rowe Price:

- The average participation rate in auto-enrollment plans is over 42 percentage points higher than in plans without auto-enrollment (87\% participation for auto-enrollment plans compared with $45.4 \%$ for non-auto-enrollment plans).
- Participation in auto-increases is over five times higher in plans that use the opt-out versus opt-in option (66\% participant adoption in plans that use opt-out versus 13\% for opt-in).

The majority of plans at T. Rowe Price now use autoenrollment, as plans without the feature decreased from 45.5\% in 2016 to $43.3 \%$ in 2017.

## 5x <br> higher participant adoption for auto-increase with opt-out than opt-in

## PLAN DESIGN ENCOURAGES STARTING EARLY

According to a 2017 T. Rowe Price study, 94\% of participants said that retirement is a top financial priority, but most are juggling multiple, competing financial goals. ${ }^{1}$

Auto-enrollment could be an effective way to encourage employees to start saving early. In 2017, 82.7\% of employees age 20-29 participated in an auto-enrollment plan at T. Rowe Price, compared with just 27\% participation in non-autoenrollment plan. For those age 30-39, participation in auto-enrollment plans was $87.8 \%$ compared with $48.5 \%$ for non-auto-enrollment plans.

## 2017 Insights

- The 6\% default deferral rate surpassed the 3\% industry standard default rate for the first time in 2017.
- Adoption of auto-increases with opt-out surpassed adoption of auto-increases with opt-in for the first time in 2017.

Across the board, auto-enrollment plans saw higher participation rates for every participant age group, with participation by those in their prime working years (ages 30-60) close to or more than 30 percentage points higher.

## 6\% DEFAULT RATE AT ALL-TIME HIGH

The average default deferral rate for auto-enrollment plans has increased steadily since 2013. For the first time, more plans had a default deferral rate of 6\% (32.4\%) than the 3\% default rate (31.9\%) that has been the industry standard since the PPA was enacted. While the difference might be slight, it's a sign that plans are continuing to reevaluate adequate savings rates to help participants retire ready.

There may be a correlation between rising default rates and the increase in adoption of auto-increases with opt-out. In 2017, adoption of the opt-out option increased to 57\%, up from 39\% in 2016. It marked the first year that the opt-out option surpassed the opt-in option in popularity, as use of optin fell from 61\% in 2016 to $43 \%$ in 2017.

## CONSIDER AUTO-REENROLLMENT

The overall participant-weighted participation rate dipped slightly, dropping from 68.3\% in 2016 to 67\% in 2017. Participation dropped in all participant age groups under age 60, while participants age 60+ increased their participation.

Plans that have experienced a dip in participant-weighted participation may benefit from adding the auto-reenrollment feature, which automatically reenrolls participants who weren't original auto-enrolled or opted out of enrollment.

In 2017, 13\% of plans at T. Rowe Price offered autoreenrollment and experienced a success rate of $78 \%$.

T. Rowe Price.

## Potential Strategies To Consider

- Add auto-enrollment to get participants saving earlier
- Use auto-reenrollment annually to reenroll non-participants
- Reevaluate the plan's default deferral rate periodically

# Reference Point 

## Contributions

## Older Participants Drive Contribution Averages

Pretax deferral rates increased again in 2017, continuing a trend that started in the years following the end of the financial crisis. The average participant-weighted pretax deferral rate rose from $8 \%$ in 2016 to $8.3 \%$ in 2017, while the plan-weighted rate also experienced a lift from $7.3 \%$ to $7.4 \%$. In 2017, 39\% of participants increased their deferral rate, compared with $35.9 \%$ in 2016.

Participants over age 40 are primarily responsible for lifting the average pretax deferral rate, with rates ranging from 7.4\% for participants age 40-49 to $10.5 \%$ for those age 70+. The findings aren't surprising; older participants are more likely to focus on building their savings as they approach retirement. In fact, the percentage of participants making catch-up contribution has also increased, from the seven-year low of 10\% in 2011 to 12.2\% in 2017.

## FOR PLANS WITH A MATCH, 6\% REIGNS SUPREME

The significant tax reform bill signed into law in December 2017 reduced the corporate tax rate from $35 \%$ to $21 \%$. As a result, many employers reported a desire to pass along the savings to their employees through enhanced or additional benefits, including the retirement plan. For example, one company that has its plan at T. Rowe Price increased the match from a total of $3 \%$ to a total of $4 \%$, citing tax reform as the reason for the increase.

## 2017 Insights

- Contribution rates continue to increase, with participants age 40+ driving up the average rate to $7.4 \%$.
- Roth adoption by plans hit a 10-year high, but participant adoption continues to lag. The feature is most popular among participants age 20-40.
- Employer match is most common among plans with large participant populations, with the majority of plans offering a match of $50 \%$ up to $6 \%$.

The 2017 data show that plans with larger participant bases are more likely to offer a match. In 2017, the percentage of plans that offered a match was as follows:

76\%
fewer than 1,000 participants

89\%
1,000-5,000 participants

90\%
greater than 5,000 participants

Nearly half of all plans (49.4\%) with a match set the match ceiling at 6\%. This corresponds to the most popular match formula of $50 \%$ up to $6 \%$ contributed, which $31.8 \%$ of plans offered in 2017.

Overall, match formula changes by plan sponsors and increased contributions by participants appear to be raising the top match effective rate, which takes into account both employer and employee actions. The top match effective rate of 4\% has increased in prevalence from 22\% in 2015 to 27\% in 2017. During the same time period, the 3\% top match effective rate has decreased from $30 \%$ to $28 \%$. Now $59 \%$ of plans have effective match rates above 3\%, compared with 54\% in 2015.

## DOWNWARD TREND DEVELOPING?

Despite increases in 2017, the data show that the trend of plans increasing their pretax deferral rates may be slowing:

- While many plans have increased their default deferral rate over the 3\% industry standard, fewer plans made a change in 2017. Only $4.6 \%$ of plans increased the default rate in 2017, compared with $7.3 \%$ in 2015.
- There was a slight uptick in the number of participants who decreased their deferral rates in 2017-6.7\% compared with 6.2\% in 2015.

Participants continue to face barriers that prevent them from saving. In a 2017 T. Rowe Price study, only 40\% of participants said they've made a great deal of progress toward their retirement savings goals, and as many as 18\% reported not very much or practically no progress. ${ }^{1}$

## ROTH INCREASES, BUT PARTICIPANT USAGE REMAINS LOW

The notion of the "Rothification" of retirement plans hit the headlines in 2017 as Congress debated the possibility of limiting participants' pretax deferrals. While the final tax reform bill passed in December 2017 didn't include Roth provisions, adoption of Roth is growing.

In 2017, $67.4 \%$ of plans at T. Rowe Price offered Roth contributions, up from 60.3\% in 2016. Adoption of Roth has increased by nearly $55 \%$ since 2014. Participant usage has grown as well, but at a slower pace, increasing by just under 19\% from 2014 to 2017.

## >67\% <br> of plans offered Roth <br> contributions in 2017

Usage has been driven primarily by younger participants age $20-40$. This could demonstrate an increased understanding of the tax benefits Roth offers: younger participants may be taking advantage of their comparatively lower salaries (and, therefore, lower income tax brackets) by paying taxes on their contributions now so they can benefit from potentially tax-free earnings in the future.

¹Source: Retirement Savings and Spending 3 © 2017 Brightworks Partners, LLC. Conducted by Brightworks Partners (now part of NMG Consulting) for T. Rowe Price. Potential Strategies To Discuss With Your Counsel

- Educate participants about pretax and Roth contributions in light of the recent income tax table changes
- Consider taking advantage of the reduced corporate tax rate to improve or enhance your match formula.

## Strong Gains in 2017

Capping a year of strong gains, U.S. stocks again rose in the fourth quarter, pushing most major indexes further into record territory. Led by emerging markets, international stocks continued their strong run, outperforming U.S. shares in 2017. In global fixed income markets, non-U.S., emerging markets, and high yield debt led the way for the quarter and year, supported by solid credit fundamentals.

## PLANS CONTINUE TO ADD MORE INVESTMENT OPTIONS

2017 marked the fifth straight year that plans increased the number of options in their investment lineups. The average plan offered 16.2 investment options, up from 16.1 in 2016 and up from the six-year low of 14.5 in 2012. (Target date products are counted as a single investment.)

Conversely, participants have continued to reduce their investment holdings over the past 10 years. The average number of investments in a participant's account was 2.5 in 2017, down from the high of 3.0 in 2008.

## TARGET DATE INVESTMENT INCREASES

Plan adoption of target date products reached a 10-year high, rising to $94 \%$ in 2017. Since 2011, the number of plans offering target date products increased by over 9\%.

## 94\% |"

of plans offered target date products in 2017

## 2017 Insights

- Plans continue to add more investment offerings to their lineups, even as participants invest in fewer of them
- Nearly all plans now offer target date products, and the majority of younger participants are investing in them.

Target date products now account for the largest percentage of plan assets under management. Over 41\% of total assets under management in 2017 were invested in target date products, with $34.8 \%$ in stock investments. In fact, investments in target date products surpassed stock investments in nearly every plan-size-related category in 2017, with just a few exceptions in smaller plans:

- In plans with fewer than 1,000 participants, stock investments averaged 42.9\% compared with 37.7\% for target date products.
- In plans with less than $\$ 5$ million in assets under management, stock investments averaged 39.9\% compared with $39.7 \%$ for target date products.

## A GENERATION RAISED ON TARGET DATE PRODUCTS

The rise in popularity of target date products is most likely twofold. First, target date products' popularity could speak to participants' desire to have a more managed approach to asset allocation. As investments in target date products have increased since 2013, there's been a corresponding decrease in other asset classes (e.g., stocks and bonds).

Second, the Pension and Protection Act of 2006 granted legal certainty for plan sponsors to offer auto-enrollment, and target date products satisfy qualified default investment alternative (QDIA) requirements. A greater number of participants invest in target date products because their contributions were defaulted into one of the investments when they were automatically enrolled in the plan.

The age breakdown of target date investors supports this second point in particular. Target date investment is highest among participants age 20-40, who were more likely to have been auto-enrolled than their older peers. In 2017, the percentage of assets in a target date product was highest in the following age groups:

- <20 years: 74.7\%
- 20-29 years: 73.4\%
- 30-39 years: 56.7\%

## GREATER FAMILIARITY WITH TARGET DATE PRODUCTS

Since 2013, participants have increasingly invested in a single target date product. In 2017, 56\% of participants held a target date products as the sole investment in their portfolio, compared with $46 \%$ in 2013-an increase of nearly $22 \%$. This change could indicate greater understanding of how target date products can function as the only holding in an account.

The principal value of target date products is not guaranteed at any time, including at or after the target date, which is the approximate year an investor plans to retire (assumed to be age 65) and likely stop making new contributions in the product. If an investor plans to retire significantly earlier or later than age 65, the products may not be an appropriate investment even if the investor is retiring on or near the target date. The products' allocations typically invest in a broad range of underlying mutual funds that include stocks, bonds, and short-term investments and are subject to the risks of different areas of the market. In addition, the objectives of target date products typically change over time to become more conservative.

Call 1-800-922-9945 to request a prospectus, which includes investment objectives, risks, fees, expenses, and other information that you should read and consider carefully before investing.

## Gen $Y$ and Gen $Z$ are more likely to invest in target date products than older generations

## Potential Strategies To Consider

- Consider evaluating your investment lineup to see how many the average participant invests in and if any changes are necessary to meet participants' needs
- Consider providing target date education geared toward younger participants
- If your plan has a high number of participants with nondiversified investments, consider additional investment education regarding the importance of diversification. You might also want to consider a "QDIA reset," which moves participants' existing balances and future contributions into a qualified default investment alternative ("QDIA"), with an appropriately communicated opt-out option.

## Loan and Disbursement Behavior

## Fewer loans but greater availability

For the third year in a row, the percentage of plans that permit loans increased in 2017 to $87.2 \%$, up slightly from 87\% in 2016. Loan availability has risen over the past 10 years, increasing by nearly 8\% from a low of 80.9\% in 2008.

But as loan availability increased, participant usage waned slightly over the past few years. In 2017, 23.4\% of participants had an outstanding loan balance, down from the recent high of $24.9 \%$ in 2013.

## 230 of participants

had an outstanding loan balance in 2017

## CHANGING VIEWS OR GENERATIONAL INFLUENCES?

There's been a concerted effort to better educate participants about the potential downsides of plan loans. While loans allow participants to borrow from their accounts rather than a third party, and interest is paid back into the participant's account, the participant must pay back the loan in full prior to separation of service or face tax consequences.

Loan education may be encouraging participants to research alternatives to borrowing from their retirement savings. It's also likely that loan usage is being affected by changes in the workforce:

## 2017 Insights

- Loan usage is highest among older Gen X and younger Baby Boomer participants.
- Close to half of participants in their 20s cash out their savings rather than rolling over.
- There was no change in hardship withdrawal usage in 2017, despite being a costly year for weather and climate disasters.
- Millennials: The largest generation since the Baby Boomers, Millennials entered the workforce in mass numbers. Many have now accumulated enough wealth in their retirement plans to be eligible for loans. However, the percentage of Millennial participants with outstanding loans decreased last year. For participants age 20-29, the percentage dropped from $11 \%$ in 2016 to $10.7 \%$ in 2017. For 30-39 year-olds, the percentage dropped from 26.1\% to 25.3\%.
- Gen X and Baby Boomers: These two generations have reached the so-called "sandwich" years, when they're more likely to be supporting younger and older family members. Participants age 40-59 have the highest percentage of outstanding loans: 30.7\% for those age 40-49 and 27.5\% for the age 50-59 group (older Gen X participants and the younger Baby Boomers).

Overall, Ioan usage decreased from 23.8\% in 2016 to $23.4 \%$ in 2017, although the percentage of participants with outstanding loans increased by an average $2.2 \%$ for participants age 50+.

## DIRECT ROLLOVER AND CASH-OUT RATES STATIC

Direct rollover rates remained at 81\% in 2017, the same as in 2016, when direct rollovers reached a 10-year high. The same was true for cash-outs, with rates of 19\% in 2016 and 2017.

Over three-quarters of participants age 40-69 took a direct rollover rather than a cash-out in 2017. Among younger participants, rollovers increased or stayed steady. However, nearly half ( $47 \%$ ) of participants age 20-29 cashed out their account balances last year, indicating that additional education about the importance of saving early may be necessary.

## $>750 / 6$ of participants age 40-69

took a direct rollover versus a cash-out

Unsurprisingly, cash-outs remain highest among participants who are less than 20 years of age. The percentage of direct rollovers by this population fell by $37 \%$, with $83 \%$ of participants taking a cash-out.

## NO CHANGE IN HARDSHIP WITHDRAWAL USAGE

According to the National Centers for Environmental Information (NCEI), 2017 was the costliest year on record for natural disasters, with 16 weather and climate disaster events that each resulted in losses over \$1 billion. ${ }^{1}$ Federal disaster declarations allowed a greater number of participants to take a hardship withdrawal in order to pay for costs related to the disasters.

Despite the weather and climate events, hardship withdrawal usage was static. Participant usage remained at $1.4 \%$ for the third year in a row, down from the seven-year high of $1.9 \%$ in 2011. Average hardship withdrawal amounts increased by nearly $2 \%$ to $\$ 7,059$, up from $\$ 6,923$ in 2016. In addition, the percentage of plans that offer hardship withdrawals increased slightly in 2017 to 70\%.
'Source: NOAA National Centers for Environmental Information (NCEI) U.S. Billion-Dollar Weather and Climate Disasters (2018). https://www.ncdc.noaa.gov/billions/

## Potential Strategies To Consider

- Benchmark your plan's direct rollover and cash-out rates to see if additional participant education is needed.
- Add a financial wellness program to provide participants with budgeting resources.
- Consider age-targeted messaging about cashing out for younger participants in particular.

## Methodology

Unless otherwise noted, all data included in this report are drawn from the following sources: Data are based on the large-market, full-service universe-TRP Total-of T. Rowe Price Retirement Plan Services, Inc., retirement plans (401(k) and 457 plans), consisting of 636 plans and over 1.6 million participants.

Auto-enrollment, auto-increase, and default deferral rate results are based on participants of large-market, full-service $401(k)$ and 457 plans who were automatically enrolled in their plan during 2017. Trend results are based on findings at the calendar year-end from 2008-2017.

Auto-Reenrollment-An automatic reenrollment for participants who opted not to participate in their plan. This is run on-demand and could occur about once a year.

Auto-Restart-For participants who were contributing to their plan and have taken a hardship, once the suspension period is over, participants will have their contributions automatically restarted unless they opt out.

Auto-Rebalance-Provides participants with the tools they need to maintain a consistent investment strategy. If they are not investing $100 \%$ of their account in a diversified fund, auto-rebalance will automatically rebalance their account on a periodic basis (i.e., quarterly or annually).

Participation rates by age are participant weighted (total number of participants divided by the total number eligible to participate). Participant-weighted year-over-year participation rate averages are calculated by dividing the number of participants by the number eligible to participate. The plan-weighted year-over-year participation rate average is the sum of plan-level averages divided by the number of plans.

The data are based on any participants eligible to make contributions during the period. Participation results are based on all contributions. Participation rates by age are participant weighted (total number of participants divided by the total number eligible to participate).

## Methodology

Unless otherwise noted, all data included in this report are drawn from the following sources: Data are based on the large-market, full-service universe-TRP Total-of T. Rowe Price Retirement Plan Services, Inc., retirement plans (401(k) and 457 plans), consisting of 636 plans and over 1.6 million participants.

Employee and employer contributions are based on plans with contributions during the calendar years ended December 31, 2007, through December 31, 2017. Employer contributions include all types of employer money, such as matching contributions, discretionary contributions, and retirement contributions. Match percentages are the maximum percentage of participant contributions that a company will match. Company vesting percentages shown are an aggregated count of those plans and plan locations that have identifiable vesting schedules for reporting purposes.

Deferral results are based on employee pretax deferral percentages greater than zero for eligible participants over various time periods from calendar years ended December 31, 2007, through December 31, 2017. Average deferral by age is participant weighted (total of all participant deferral percentages divided by the total number of participants with a deferral percentage).

Catch-up contribution results for participant age breakdowns are based on the number of participants who made catch-up contributions during the various calendar year periods ended December 31, 2007, through December 31, 2017. These data capture the number of eligible participants over age 50 in plans that offer catch-up contributions.

Results for participant age breakdowns are based on the number of participants who made Roth contributions during the calendar year periods ended December 31, 2008, through December 31, 2017. These data capture the number of eligible participants in plans that offer Roth contributions at each calendar year-end from December 31, 2008, through December 31, 2017.

Roth qualified distribution-A qualified distribution is tax-free if taken at least five years after the year of the first Roth contribution and if the participant has reached age $591 / 2$, become totally disabled, or died. If the distribution is not qualified, any earnings withdrawn will be taxable. These rules apply to Roth distributions only from employersponsored retirement plans. Additional plan distribution rules apply. Participants are encouraged to consult with their tax advisor when determining if Roth contributions are right for them.

## Methodology

Unless otherwise noted, all data included in this report are drawn from the following sources: Data are based on the large-market, full-service universe-TRP Total-of T. Rowe Price Retirement Plan Services, Inc., retirement plans (401(k) and 457 plans), consisting of 636 plans and over 1.6 million participants.

Loan availability and usage results are based on active participants with outstanding Ioan balances at calendar years ended December 31, 2008, through December 31, 2017. Participant loans are limited to plans that offer loans. Hardship withdrawal data represent all hardship withdrawals from qualified $401(\mathrm{k})$ and 457 plan types at calendar years ended December 31, 2008, through December 31, 2017.

Distribution data represent all distributions and hardship withdrawals from qualified 401(k) and 457 plan types for various time periods from calendar years ended December 31, 2008, through December 31, 2017. The rollover/cash-out percentage is based on the amount of assets cashed out or rolled out of a retirement plan account for any participant, including both active and terminated, during the calendar year ended December 31, 2017.

[^0]:    Note: The success rate is used to define how successful the one-time event was in maintaining participation when offering the service to employees. The success rate is the count of participants that enrolled through the service process divided by the count of participants that actually completed the service process. Employee participation-for auto-rebalance-conveys actual employee adoption of the service.

[^1]:    Most plans offer auto-increases as a voluntary option (the "opt-in" method), while fewer plans automatically enroll participants in auto-increases (the "opt-out" method).

[^2]:    Note: Participant ranges define those plans where total participant counts fall within the specified ranges. Investment category labels were derived from recognized Morningstar categories.
